

Apple Health Case Study

TIFFANY C

3 / Design Process & Scoping

Initial Questions / Assumptions

How might we encourage users to open the app everyday?

What kind of apps I use on daily basis - chat, social media, alarm, calendar, finance record, is that all?

Who else would use Health?

Quick check with people around me, 100% do not use it on daily basis, but somewhat acknowledge that iPhone has a built-in app called Health

- Even active lifestyle / health conscious users (2 - 3 times workout / week) do not use it at all
- Apple watch users are not frequent users too, stop using it during MCO

Why it has not been strongly promoted by Apple? Why it build on top of other apps. Intentions?

As a built-in app, how should this be “repositioned”, so that it will not be another health / fitness app?

Product Overview

Goals

- The Health app consolidates data from Apple Watch, iPhone and 3rd party apps
- Organise and access important health information
organise and access your important health information - e.g. medical report, medical ID archive
= Store data
- Academic research CareKit, ResearchKit
- iCloud storage consumption

Offers

- Provide convenience
- Cross-sell other apps - ability to incorporate data from thousands of apps
 - meditation
 - medication reminder
 - water intake
 - workout
 - daily food intake
 - weight tracking
- Works with Alarm / Bedtime

Conclusion

As HPD for Apple, I understand that health covers a broad spectrum of domains, which are respectively niche and deep knowledge. Health app could only play a role as a data aggregator and provide convenience for all apps in one place. However, in order to make it a key product, the **positioning of this app should be pivoted.**

Apple Health Case Study

TIFFANY C

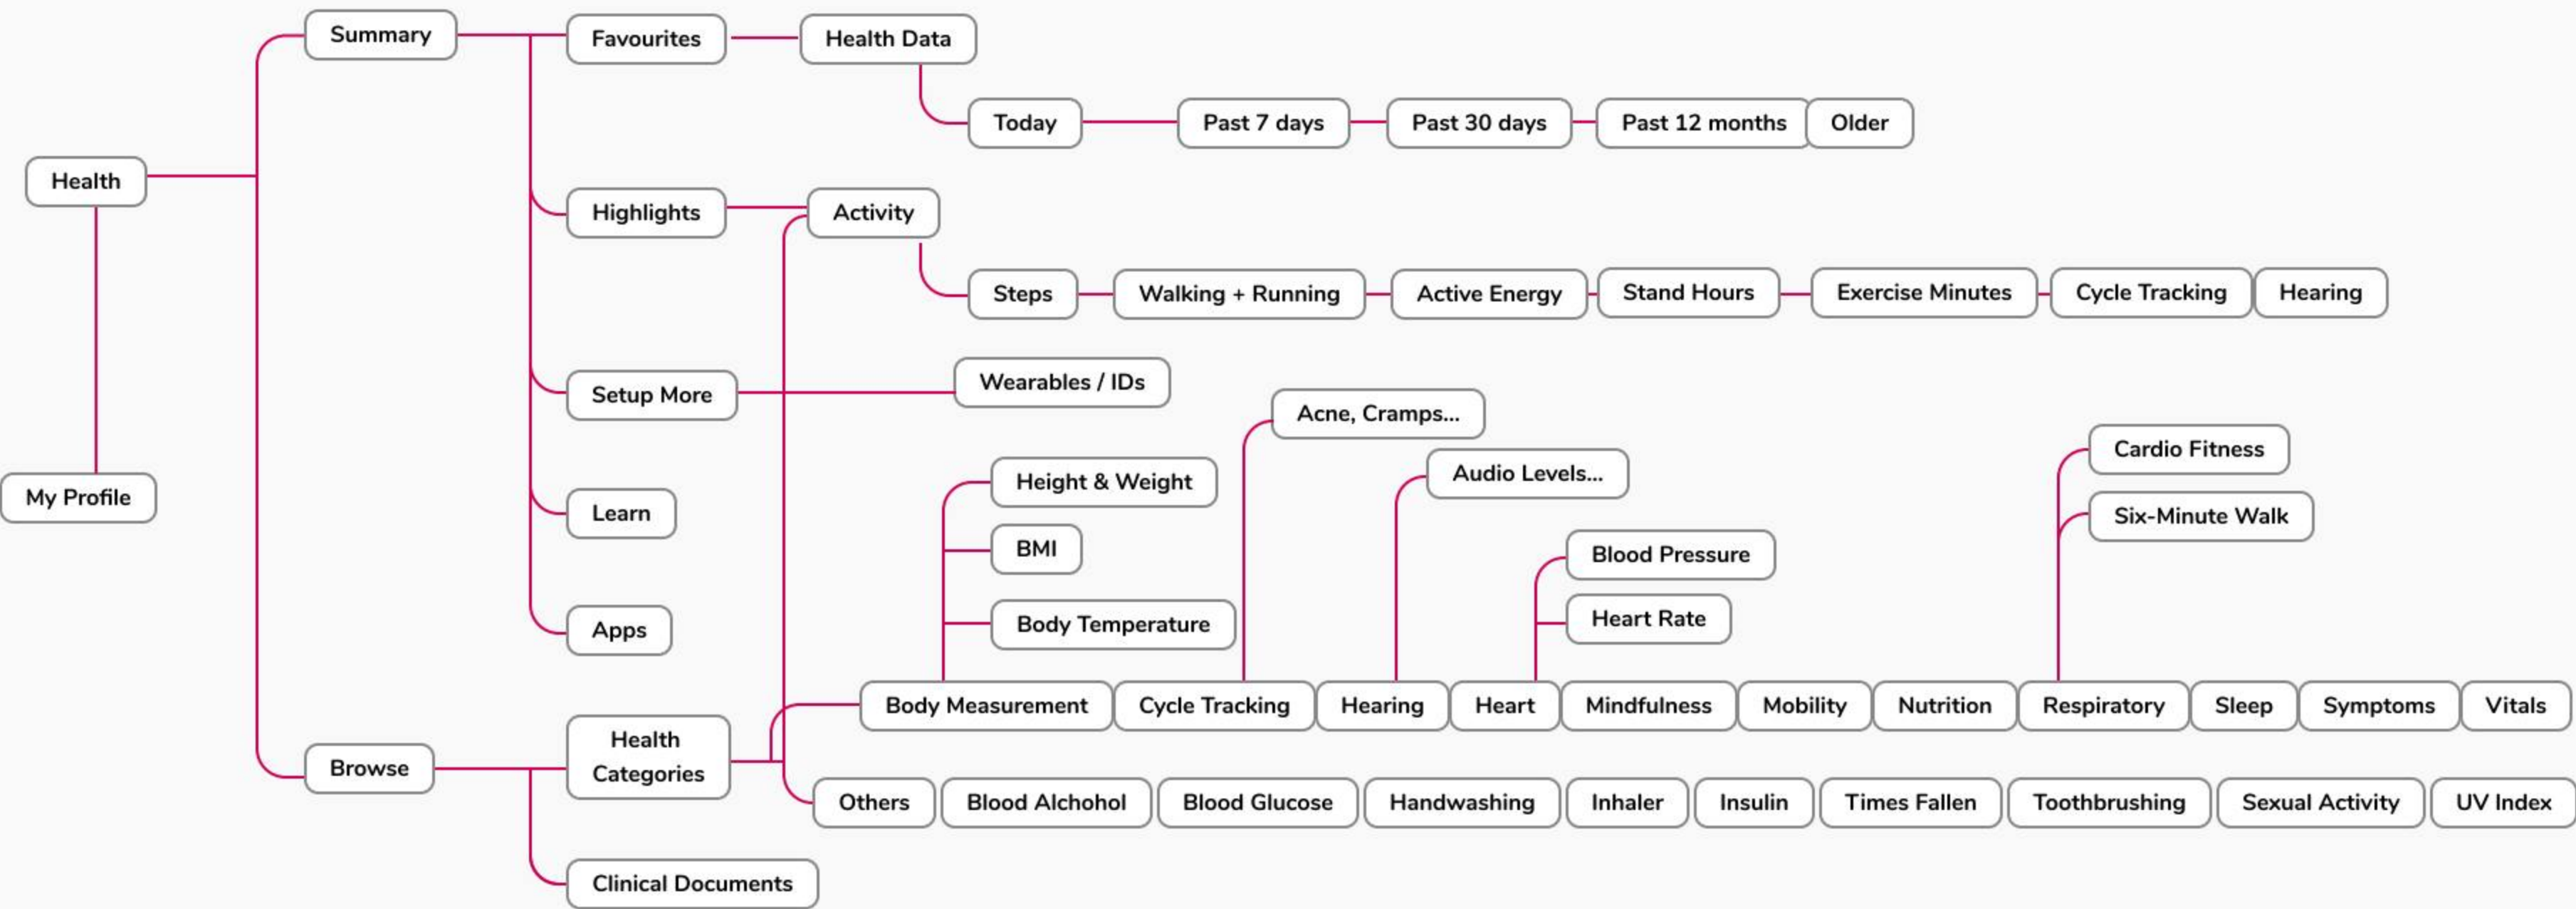

Day 1

Design Process Planning

Exploring Products

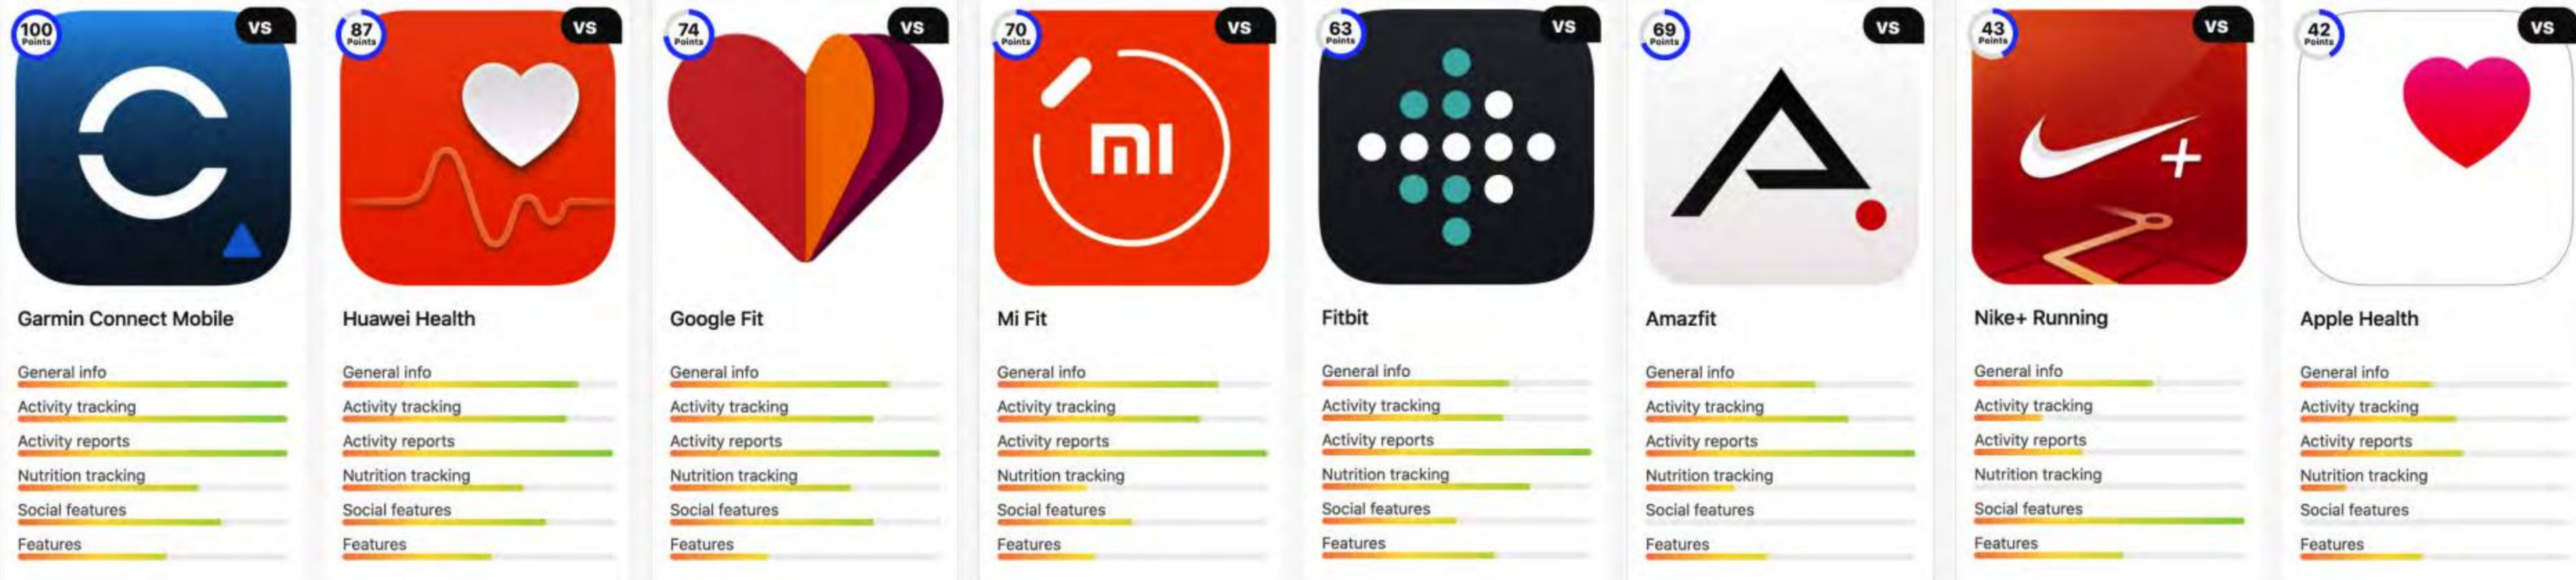

Understanding Overall Health apps

Information Architecture

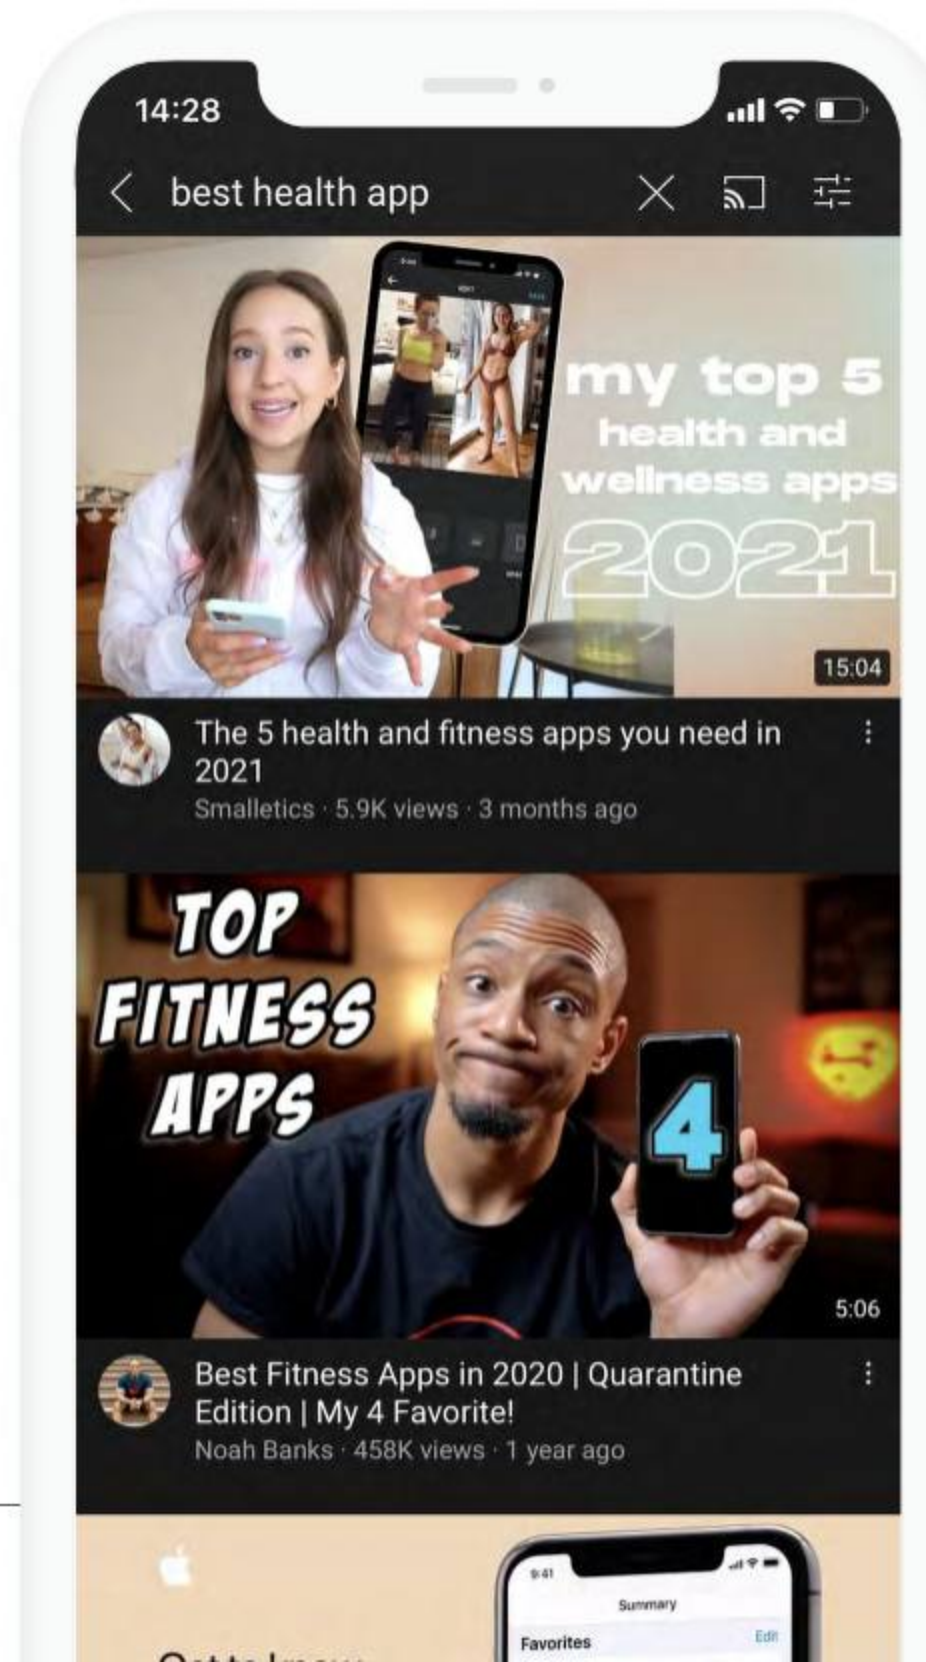

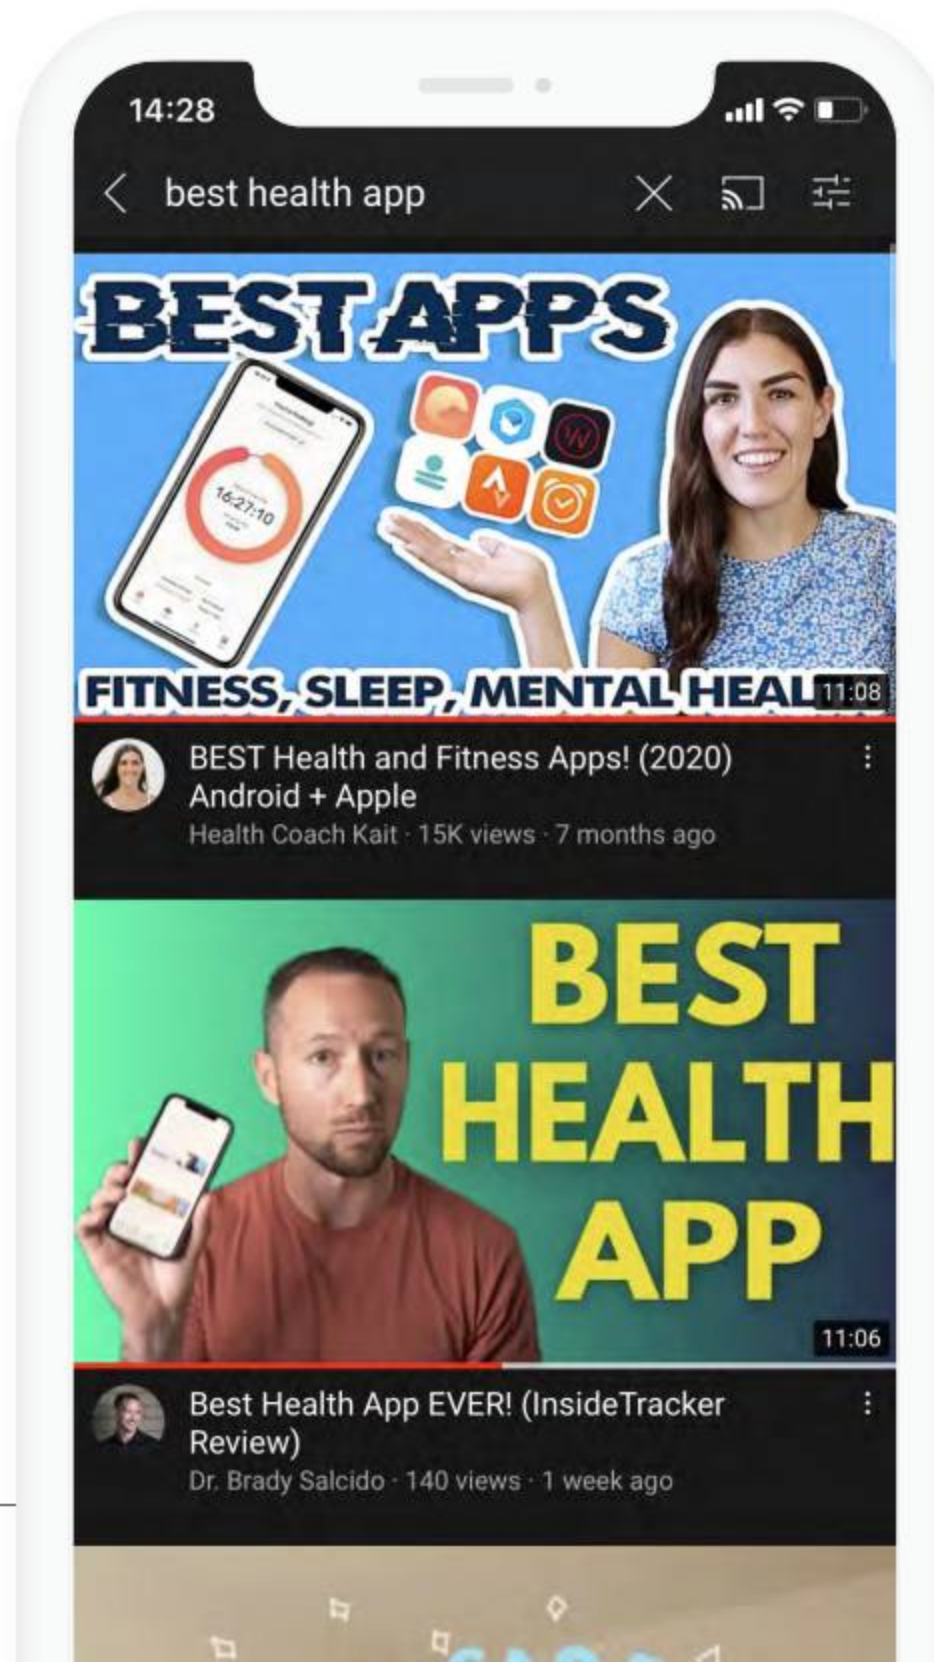

What was being compared

Insights Apple Health ranked 35th, compared to all 89 free health apps. Social features is the obvious lacking, though **"Features" alone is on par with Top 10.** Albeit Apple Health positioned itself differently, it still gets to compare with other health & fitness app.

What people say recently

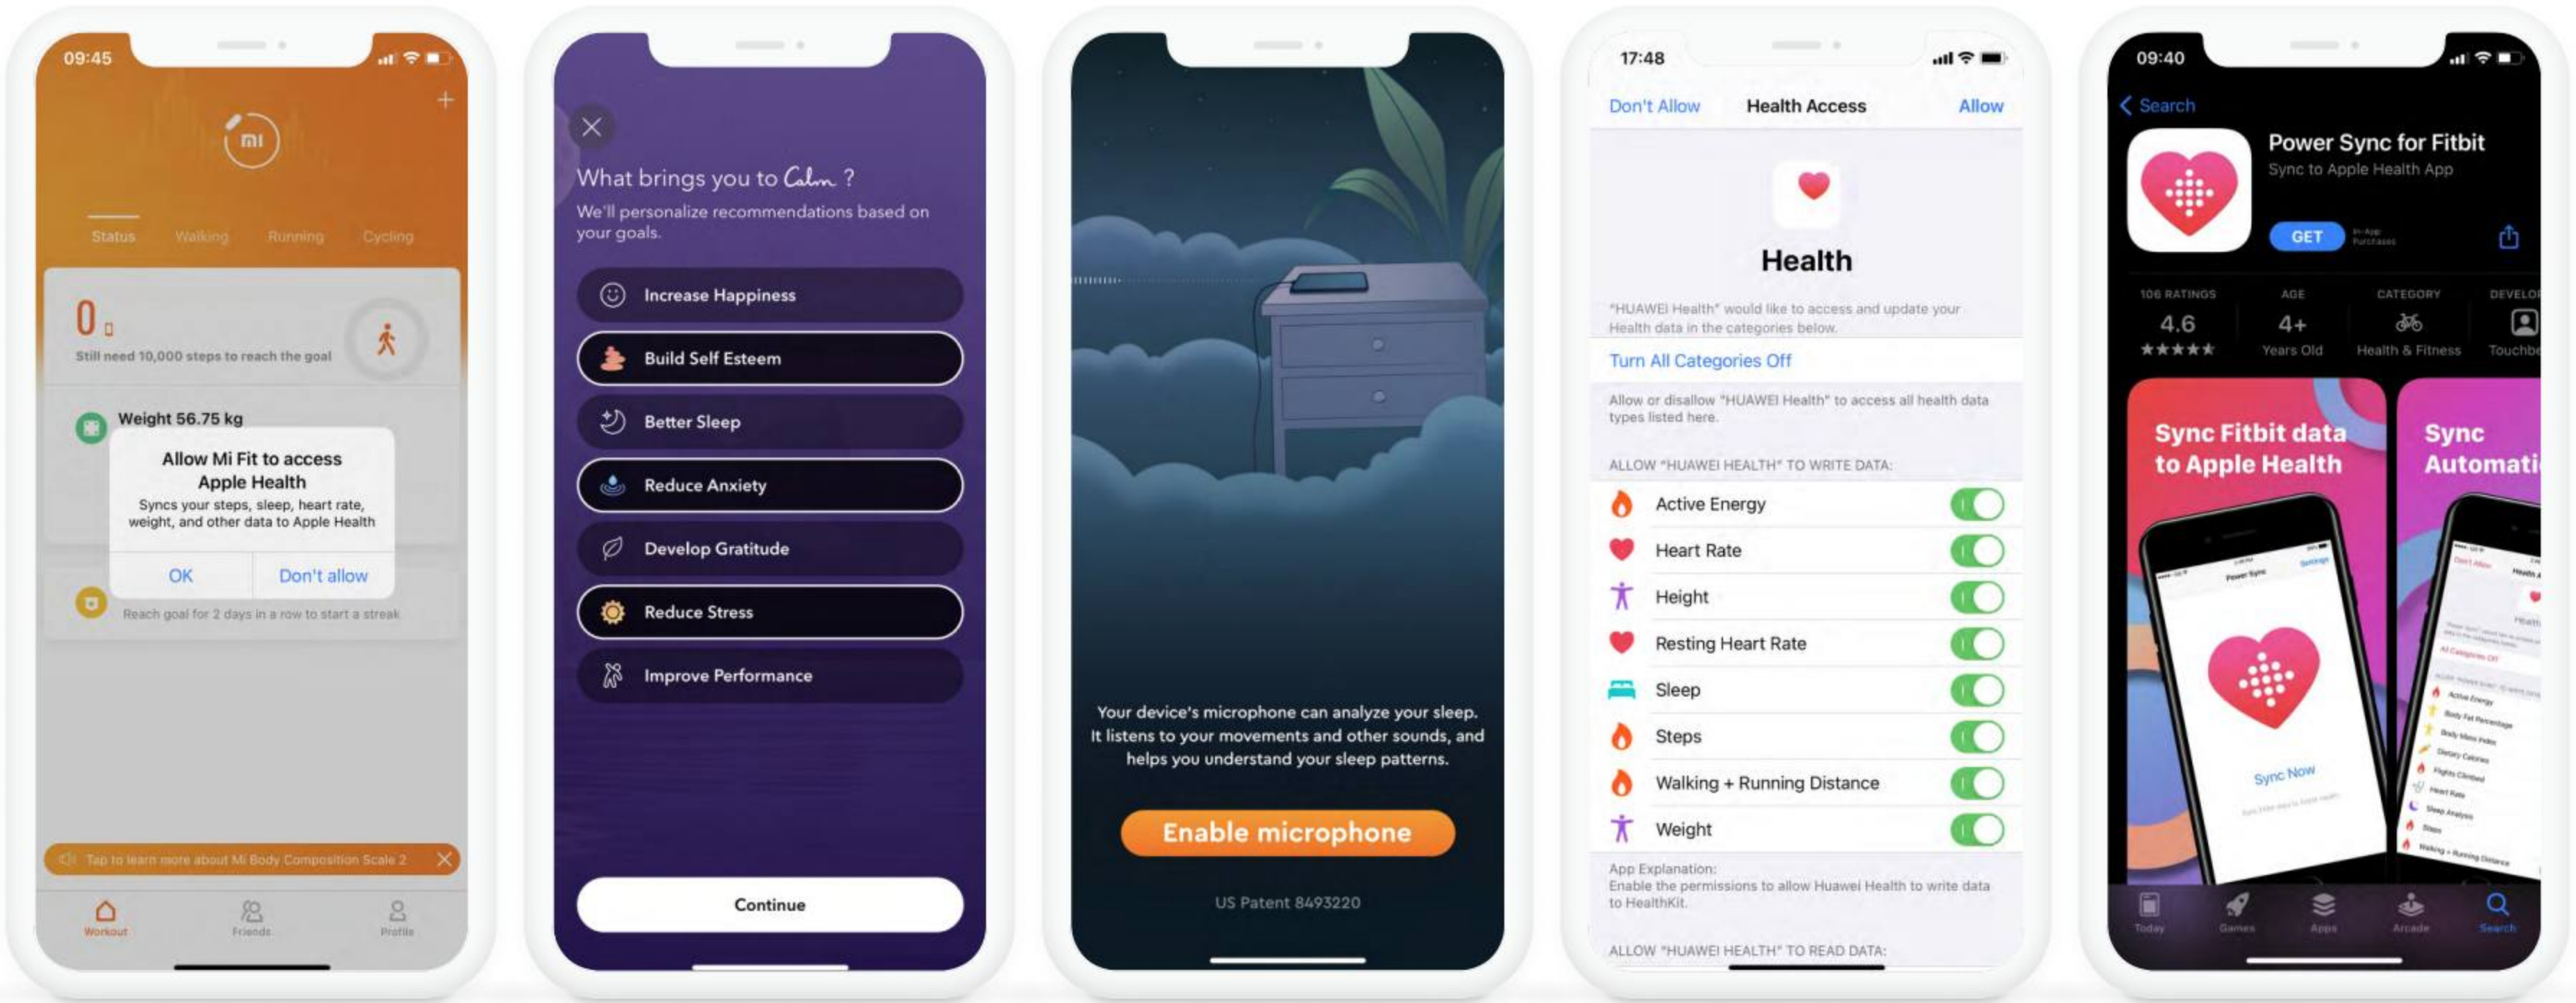

Key Takeaways

- Some are always pair with wearables, different business model, subscription mode on wearables, or outright wearable free app - usually
- Always mention 1 with gamification experience
- Usually start with personalisation - e.g. height, age, gender etc.
- when search "Health app reviews" on YouTube "Best Fitness App" will come up too:
 - Fasting (Weight Management)
 - Sleep Monitoring
 - Meditation (Mental Health)
 - Food Tracking
 - Fitness / Exercise Tracking @ gym + personal programme
 - Habits Tracking (e.g. Done, brain training)

Insights

Common things mentioned by influencers / coaches / health advisors - health is down to habits, start with small habits building will influence health in long-run.

How they work

Apple Health Case Study

TIFFANY C

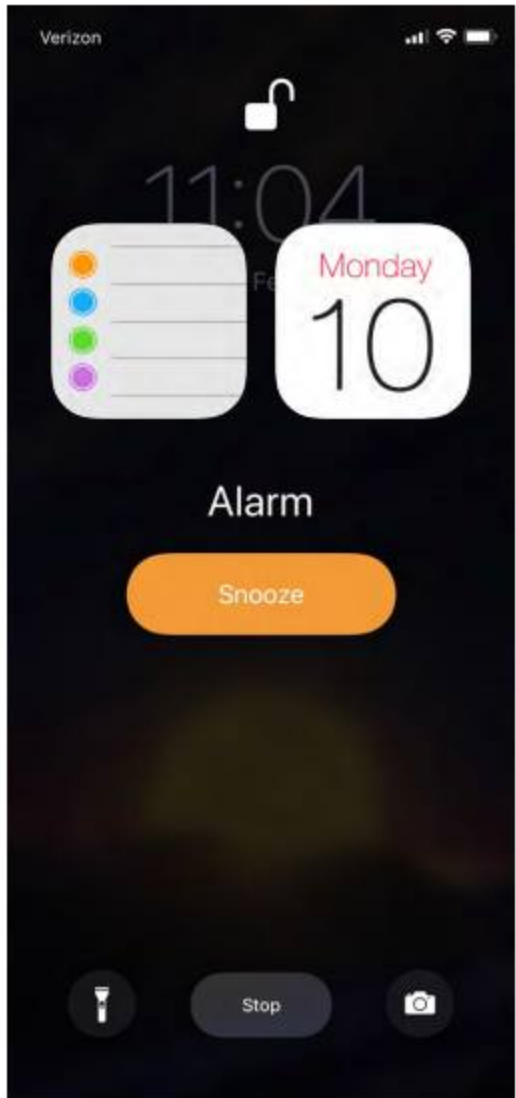

Day 2

Hypothesis Writing

Survey Planning & design

Questionnaire & Forms Building

Hypothesis Writing

“How might we encourage users to use Health app everyday?”

Hypothesis

There is no one-size-fit-all Health app, as people are motivated by different reasons to stay healthy or become healthier in their own definition. Since health experts advise to start with small good habits, e.g. steps, drinking water, practice mindfulness etc. In addition, motivation is often related to goals setting (Goal Setting Theory of Motivation) - weight loss, improve body figure, but achieving it is another story. By acknowledgement of achieving small habits throughout the day. It is possible to use Health to link apps such as alarm, reminder other apps in the iPhone to influence user's responsiveness, and instill new perceptions towards the Health app.

“I believe good habits recognition given via the Health App, that celebrate daily small wins for users, such as avoid snoozing the alarm, start a day with good breakfast, and remember to walk the dog, will increase uses of Health App on daily basis.”

Evidence

1. Agree habits forms healthy lifestyle > more than 70%
2. Likelihood to need nudge or motivation to achieve goals > more than 70%

Product & User Survey Guide

Studies Focus Area

Users

- 1. Frustration - Pain
- 2. Motivation - Gain
- 3. Aims
- 4. Interests
- 5. Behaviours & Emotions (use of products)

Products

- 1. Heuristic evaluation
- 2. Features audit
- 3. Redefine Product Goal / Proposition

#1: Visibility of system status
#2: User control and freedom
#3: Aesthetic and minimalist design
#4: Consistency and standards
#5: Flexibility and efficiency of use

Reference: <https://www.nngroup.com/articles/ten-usability-heuristics/>

Frequency: None - All the time
Users: None - All the users

Survey Design

Qualitative Research
Interviews

Objectives

To understand in-depth users sentiments towards Health app, expectations, behaviours, frustrations and needs. Plus heuristic evaluation to identify UI problems

Product:
what / when

- Heuristic evaluation (3 evaluators)
- How products encourage / influence behaviours
- Attitude towards reminders, gamified experience
- How did they first land on Apple Health

Persona:
why / how - who

- How has they been keeping up with health goals. Challenging - Why? - Frustration
- Agree if good habits form healthy lifestyle - Why?
- If experienced in any trackers, how it was started, when it stopped?

Sample Size

5 (ios) = 75% major issues

Quantitative Research
Questionnaire

To collect users interests in health, users attitude, motivations in measurable format. While some open-ended will be asked

- Adroid / IOS (Apple Watch users (yes / no)
- Usage: Most often use apps in iPhone / Android
- When will use Health app, why?
 - like or dislike, why?
 - Features audit
- Health categories interest
- Habits / actions categories interest: self-care, productivity, mental habits, etc.
- Goals - belief / setting / achieving

- What matters to their health / what are the priorities
- What are the frustrations
- What to achieve in individual health
- What health means
- Agree if good habits form healthy lifestyle

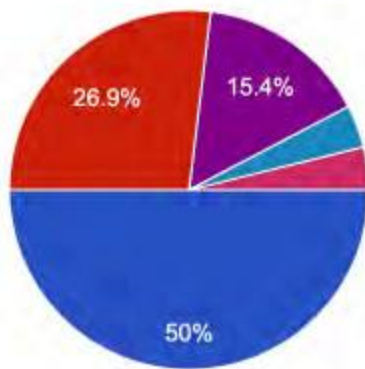

20 + (android & ios)

Questionnaire & Forms Building

Questions Responses 26

What do you do to stay healthy? (Habits, actions, plan etc.)

26 responses

- Improve daily routine (sleep, eat, water intake etc.)
- Workout
- Hire coaches or fitness instructors
- Enroll classes or courses
- Taking supplements
- Start fitness challenge with friends or family
- Stop being lazy

Do you agree that a healthy lifestyle is formed by daily good habits?

26 responses

- Agree
- Disagree
- Neutral

If you set a goal, how likely will you stick with it?

26 responses

Health - Interview

Thank you for taking the time, your kindness to help on this survey is beyond words that I can thank for! May you have a happy and blessed long weekend!

In this survey, all fitness & health apps are evaluating meditation, nutrition, sleep tracking, focus, fasting etc. - as long as you use it to assist better overall wellness.

Owners,
A product designer who is seeking ways to improve lives with design.

What does health mean to you?

- ☐ Physically fit
- ☐ Mentally stable
- ☐ More Productive
- ☐ Personal Growth
- ☐ Good relationships with people
- ☐ Feeling better
- ☐ All of above

Is it hard for you to stay active or healthy?

- ☐ Yes
- ☐ No

Apple Health app

Heuristic Evaluation

Task : To provide evaluation of how does AppleHealth app is designed for general users to engage on their health data under these selected heuristics:

- #1. Usability of system structure
- #2. User control and freedom
- #3. Aesthetics and minimalist design
- #4. Consistency and standards
- #5. Flexibility and efficiency of use

Day 3

Apple Health Case Study

TIFFANY C

Collect Data

Synthesise Findings

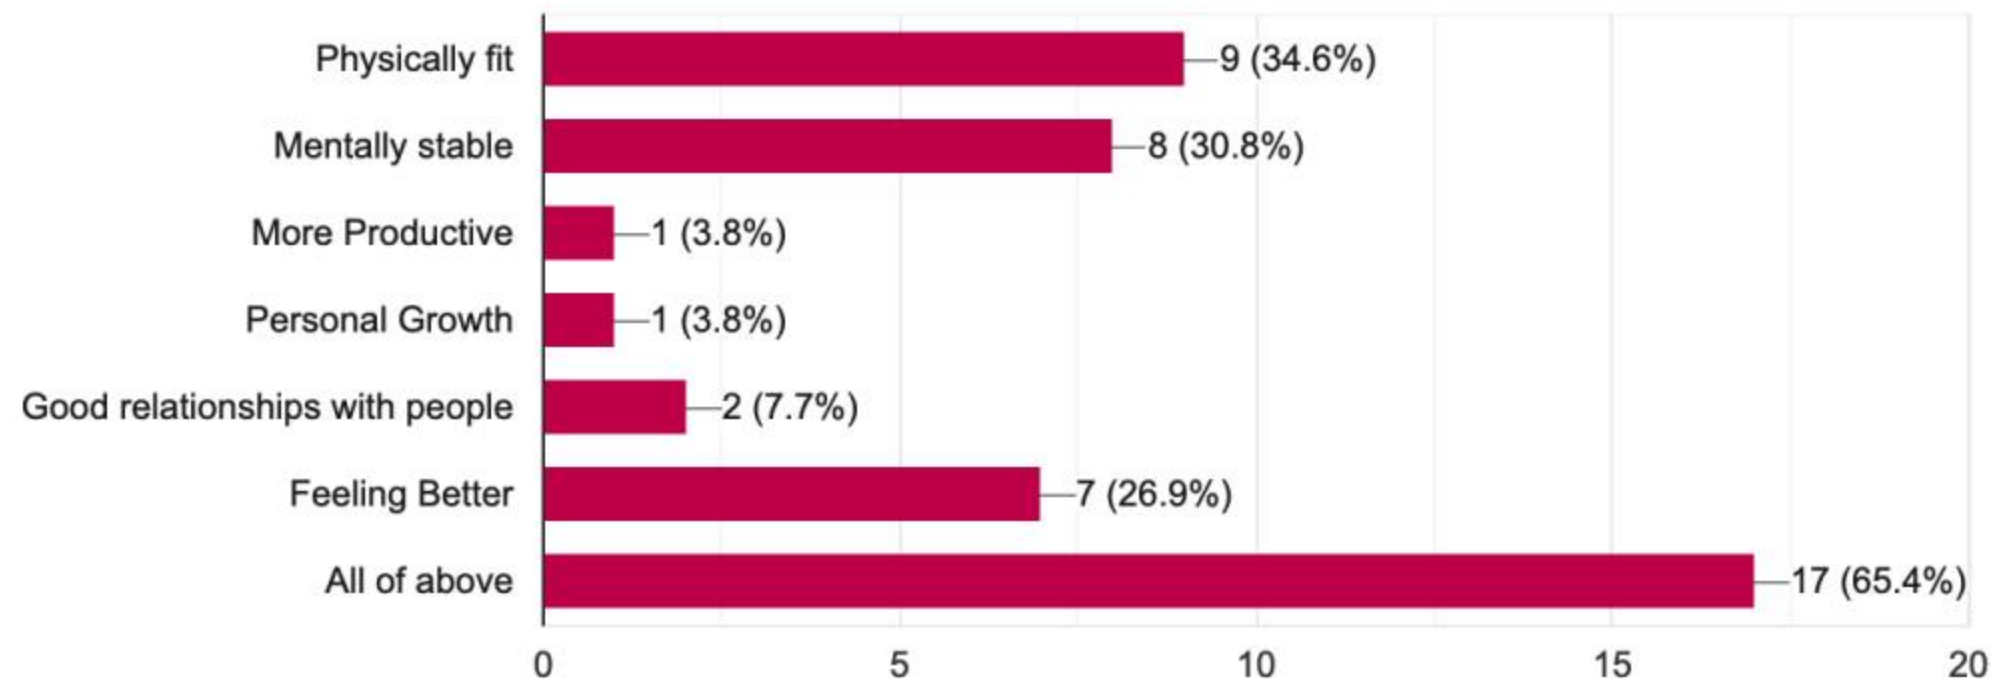

Define Problem

User Persona & Value Proposition

Questionnaire Result Analysis

Health, habits & goals

What does health mean to you?

Health means:

Physical

Mental

Social Wellbeing

Personal Growth

Productivity

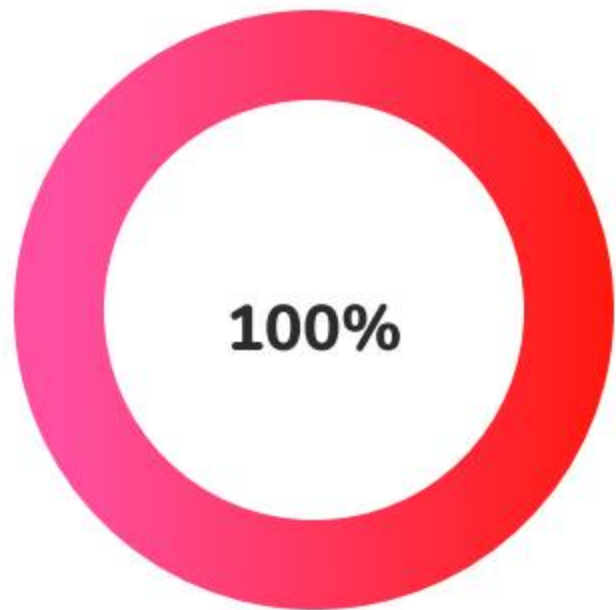

Emotional

Questionnaire Result Analysis

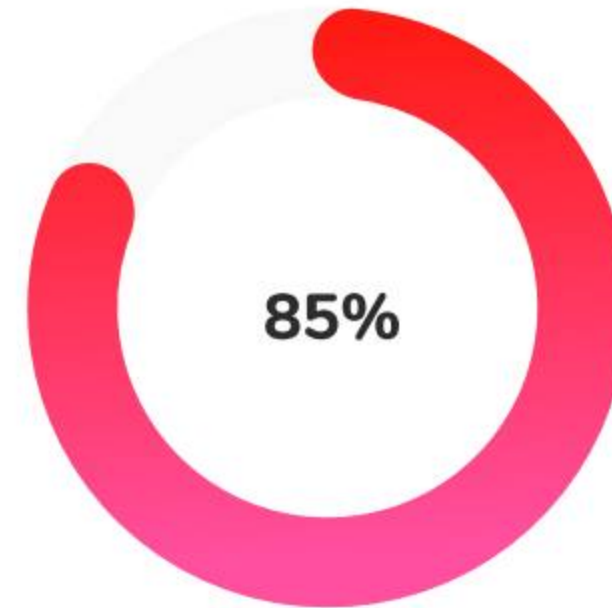

Evidence 1

100%

Agreed that a healthy lifestyle is formed by daily good habits.

Evidence 2

85%

Think they need, or are better with assistance in achieving goals.

e.g. reminders, prompt, motivation, tracker

Questionnaire Result Analysis

Staying healthy

Reason for being hard to stay healthy

Insights

7 / 12

Those who are hard to stay healthy / active **wants to improve daily routine.** e.g. sleep, eat, water intake etc.

Qualitative x Quantitative

General health / fitness apps

Top 3 desired features:

18

Tracking
/ Record

6

Analytical
Report

5

Recommendations
/ Guided methods

Insights

1. Users who workout, and have health conditions appreciate tracking features more.
2. Analytics are as desired as recommendations / guided methods (to improve health)

Qualitative x Quantitative

Apple Health & apps**10 / 11**

**iPhone users
use Alarm on daily basis**

Popularity followed by:

- Calendar, Notes
- Reminder
- Mail

3 / 3

**Apple Watch users do
not use Apple Health**

Insights

- 1. Misconception: Majority of the iPhone users thought, must link with Apple Watch to use Apple Health**
- 2. Apple Watch users, do not necessarily find Apple Fitness useful. Though workout only needs Apple Fitness - will not visit Health**

Observations & Patterns

“I appreciate features that I need”

“Apple Health suggests other apps; when I use other apps, I won’t come back for viewing data (only).”

Did Apple Fitness do better in motivating you to achieve daily goals?

“Not really, I can’t achieve it anyway (on daily basis). So did not bother.”

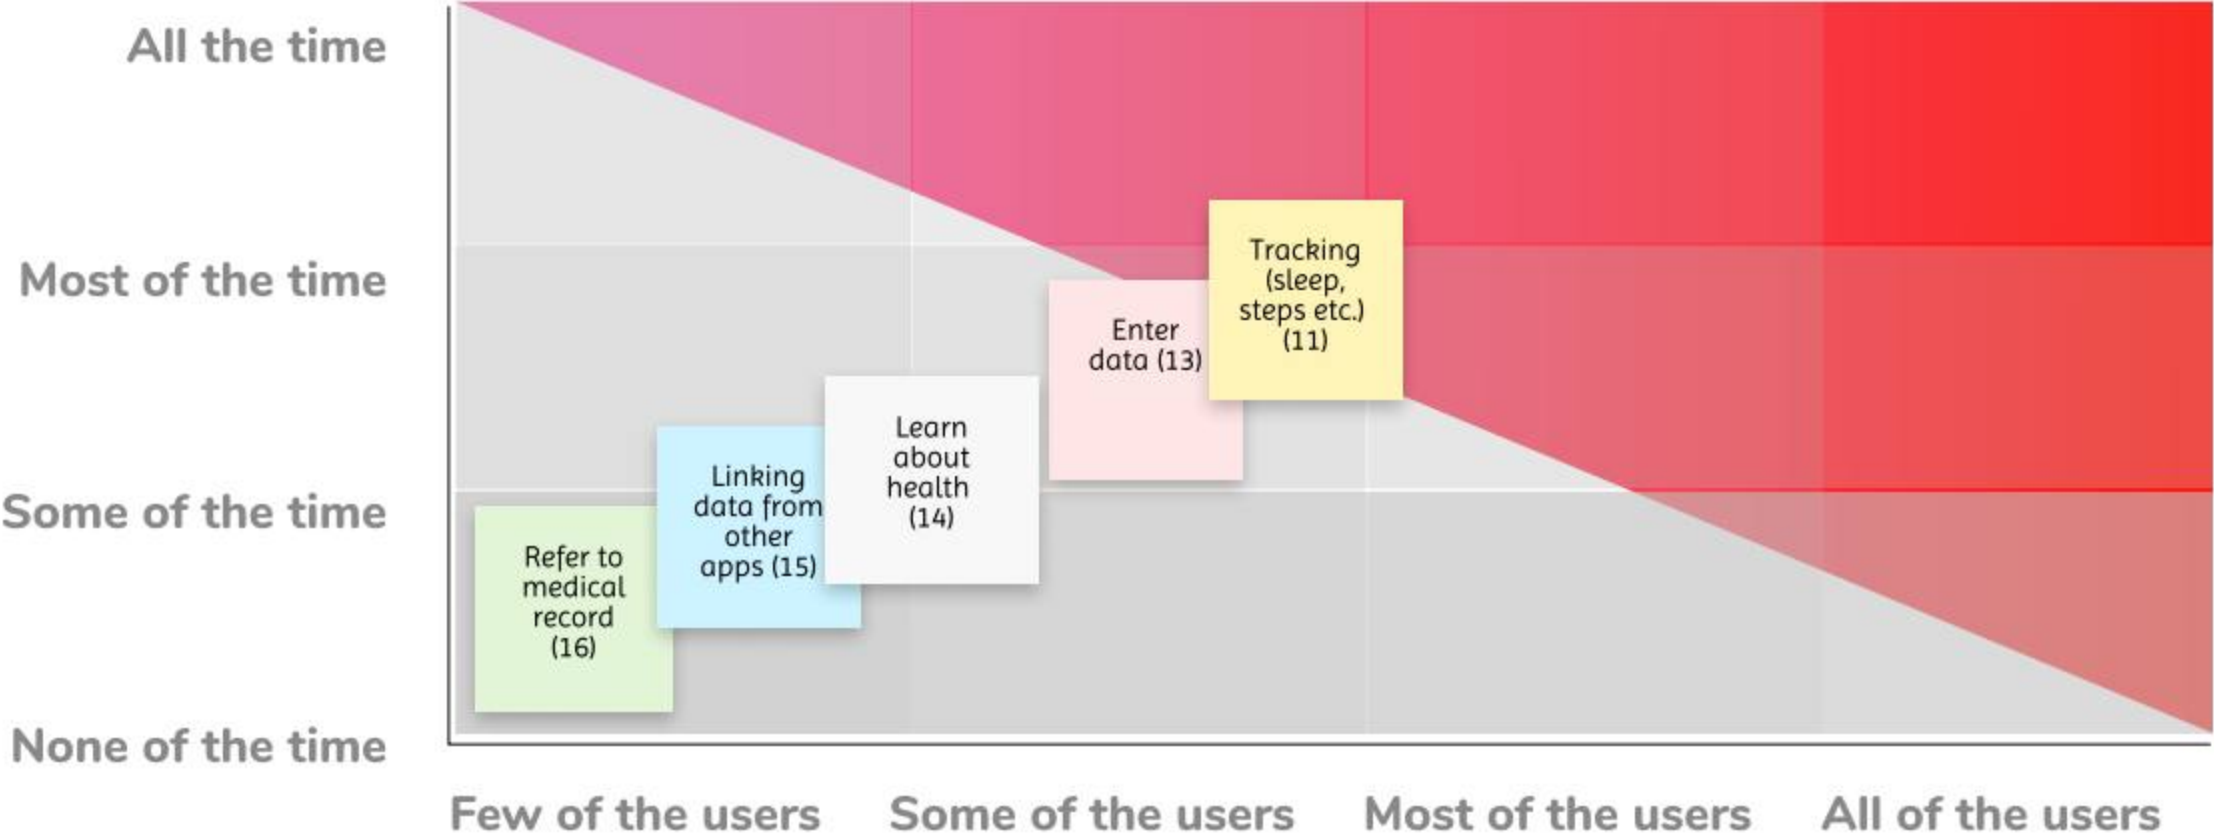

Insights

Users are clearly aware that health / fitness app is an acting assistant in achieving health goals.

Usually set goals higher than their ability to achieve.

Users generally are motivated by seeing progress of their goals.

Features Audit

Insights

Based on desired features, “Tracking” was the only best met users need. Analytical reports and recommendations were not mentioned and not found in

Heuristic Evaluation

#1
**Visibility of
system status**

#2
**User control
and freedom**

#3
**Consistency
and standards**

#4
**Flexibility and
efficiency of use**

#5
**Aesthetic and
minimalist design**

Outcome

UI improvement will be focusing on user experience and functionality (value) of Apple Health as a tool.

Primary User Persona

Xune

Age	32
Profession	Sales Executive
Location	Malaysia
Tech Literacy	High

Goal

Improve overall health, as she feel she might be overworked, and spend little attention to self and family.

“ I want to be as healthy as possible by improving my daily lifestyle

About

I am interested to go for workout to improve my health. As I have been warned to watch my heart rate, and advised to sleep on time and sleep enough. But my workload is killing me, by the end of the day, I feel too tired for a swim, and I want to rest on weekend, and no time for family. Also, I would not want perform badly at work as I am also looking for a promotion at my current company.

Motivations

- Achievement: by observing own progress
- Social: Workout with friends
- Incentive: Eat unhealthy for once in a while as reward
- Fear: Consequence of worsening health

Frustrations / Pains

- Feeling lazy, though worry sometimes
- Don't believe Health (apps) can help in improving health
- No time for manual tracking
- Unsure how else Health can help with his situation

Behaviours

- Busy with work as excuse to workout
- Wish to spend more time with family
- Sleep late due to the nature of work

Attitude to health

Not critical

Lack of motivation

Passive to learn more

Frequently use app

“Habit formation is the process by which behaviors become automatic. Habits can form **without a person intending to acquire them, but they can also be deliberately cultivated**—or eliminated—to better suit one’s personal goals”

Problem Statement

The users who set health goals need nudges and prompt in helping them to achieve. Even though they are aware that health cannot be achieved by only depending on an app, but the Health app is almost redundant in playing a role as a helpful tool for the users.

The features of the Health app offers have not attract users to engage in health, at most tracking usage - which is not enough in the users perspective. The Apple Health app is expected to be more than a tracker, to become a useful health tool for the iPhone users.

Direction to move on

Users

- Want to improve daily routine as a way to improving health
- Need nudge / prompt / motivators in achieving goals

Product

As a bespoke assistant in the health improvement journey for users.

Design Impact & Outcome

To improve users health by influencing users daily habits, start small - as motivator, or as a companion - instill humanistic approach.

Day 4

Value Proposition

**Explain the apps /
Comments**

“I can see my daily achievement, so will use on daily basis. Happy to see progress. Feel like want to do more”

“An app that can keep tracks with all my goals that i have set, and able to reminds me to do workout/habit or sleep early reminder.”

“This app can differentiate outcome goal/habit goal, is will be a good practice to change the habit of a person.”

“I always appreciate apps that help solving current dilemmas (health, wellbeing) we need better reminders especially for us in the current situation.”

Overall experience

3.75 / 5

Satisfaction Rating

5

NPS Score

Would use it
on daily basis

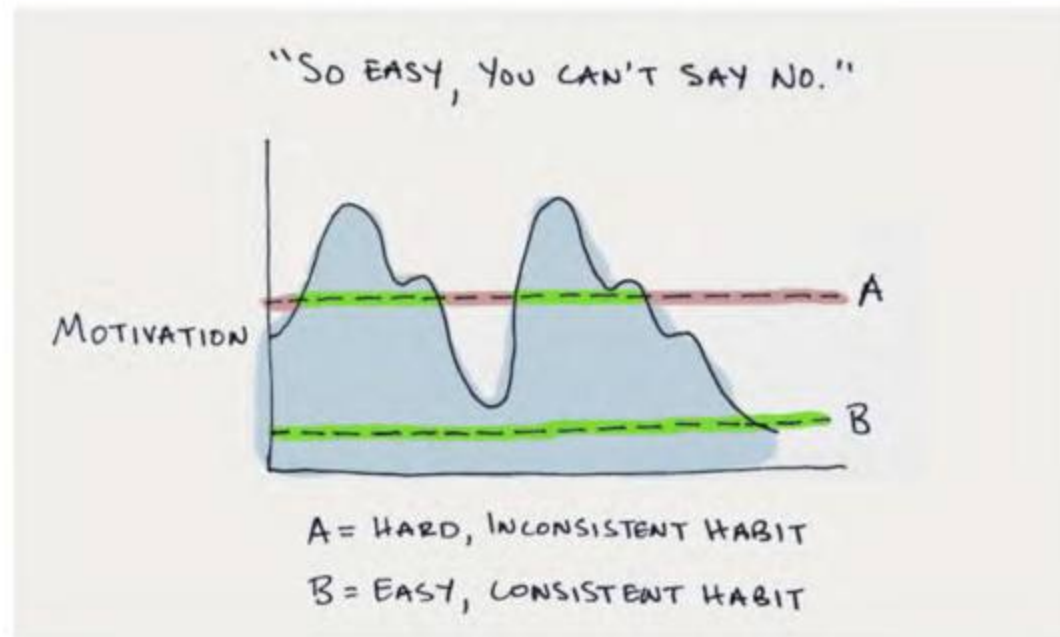

Appendices

T I F F A N Y C

1. Start with an incredibly small habit.

Make it so easy you can't say no.

—Leo Babauta

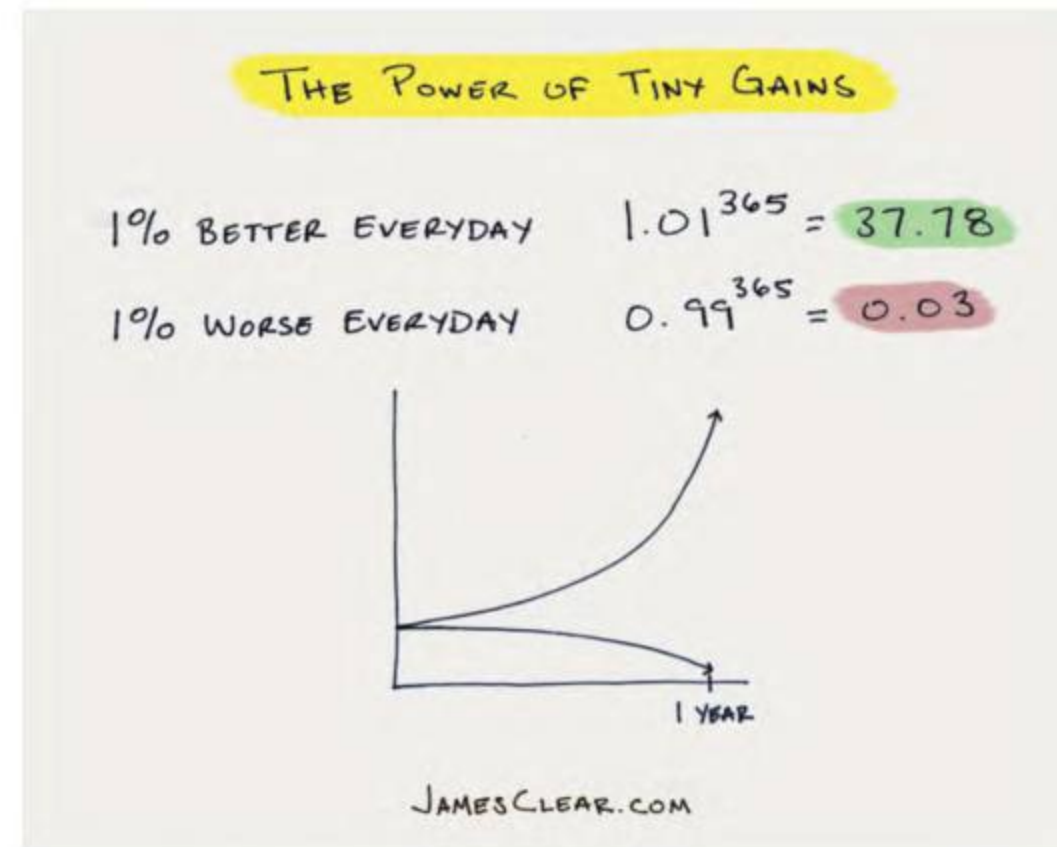

When most people struggle to build new habits, they say something like, "I just need more motivation." Or, "I wish I had as much willpower as you do."

This is the wrong approach. Research shows that willpower is like a muscle. It gets fatigued as you use it throughout the day. Another way to think of this is that your motivation ebbs and flows. It rises and falls. Stanford professor BJ Fogg calls this the "motivation wave."

2. Increase your habit in very small ways.

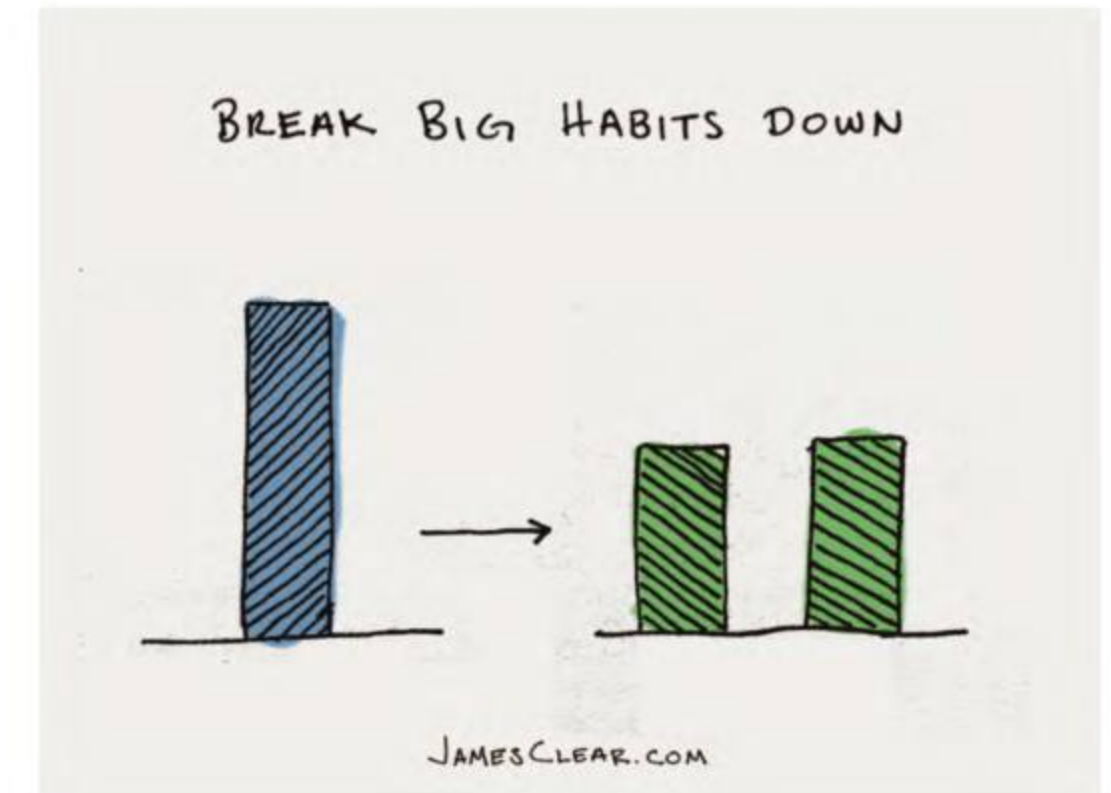

Success is a few simple disciplines, practiced every day; while failure is simply a few errors in judgment, repeated every day.

—Jim Rohn

One percent improvements add up surprisingly fast. So do one percent declines.

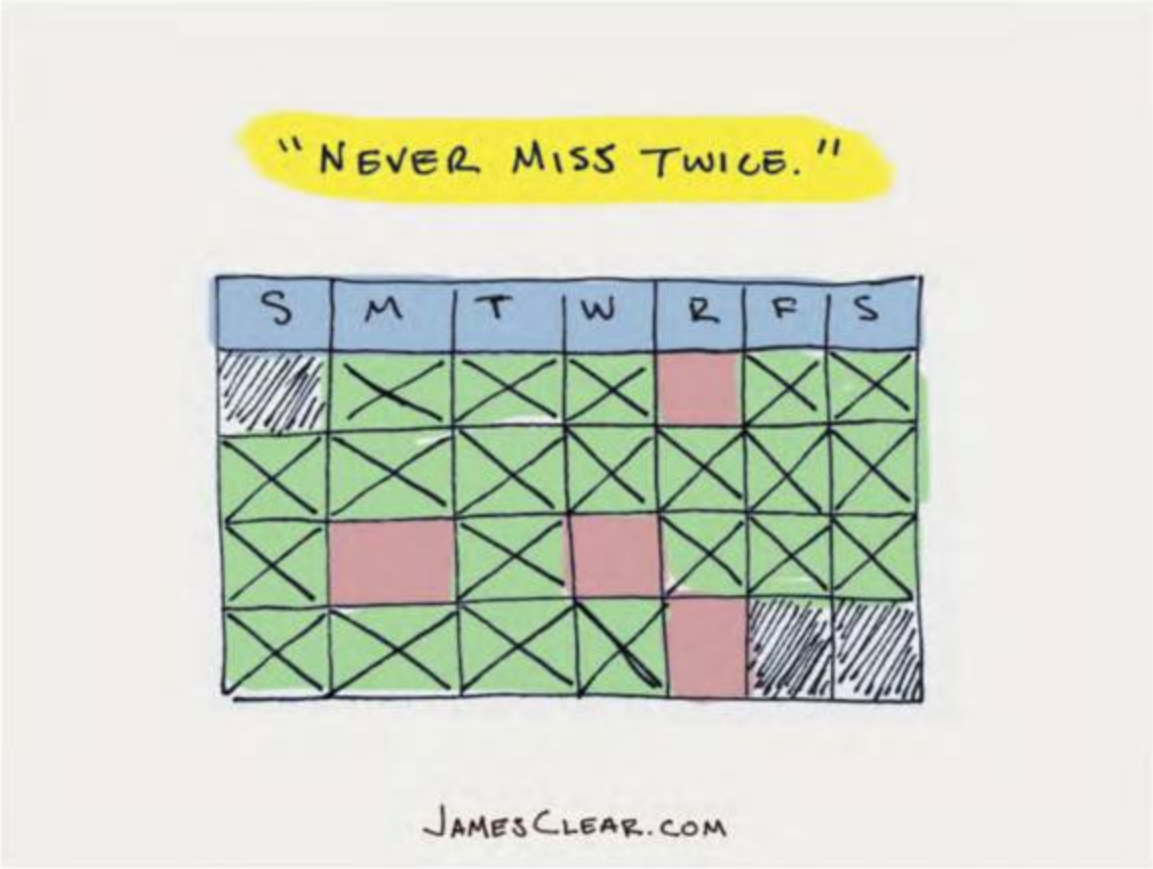

3. As you build up, break habits into chunks.

If you continue adding one percent each day, then you'll find yourself increasing very quickly within two or three months. It is important to keep each habit reasonable, so that you can maintain momentum and make the behavior as easy as possible to accomplish.

4. When you slip, get back on track quickly.

The best way to improve your self-control is to see how and why you lose control.
—Kelly McGonigal

Top performers make mistakes, commit errors, and get off track just like everyone else. The difference is that they get back *on track* as quickly as possible.

Research has shown that missing your habit once, no matter when it occurs, has no measurable impact on your long-term progress. Rather than trying to be perfect, abandon your all-or-nothing mentality.

ATOMIC HABITS

CHAPTER 16

No matter how consistent you are with your habits, it is inevitable that life will interrupt you at some point. Perfection is not possible. Before long, an emergency will pop up—you get sick or you have to travel for work or your family needs a little more of your time. Whenever this happens to me, I try to remind myself of a simple rule: never miss twice.

Ten Lifestyle Goals for Healthy Living

1. Get adequate rest daily
 - People with the best health and longevity get at least 7 to 8 hours of sleep daily.
 - Taking time for daily relaxation and recreation is also helpful to the body and mind.
2. Get regular physical activity
 - Aim for 30-60 minutes of physical activity on most, preferably all days of the week
 - Include strengthening exercise 2+ times per week to maintain a healthy lean body weight
3. Eat more plant based foods
 - Aim for at least 5 (up to 9 is recommended) servings of fruits and vegetables daily.
 - Limit fatty meats and high cholesterol foods.
 - Peas, beans, nuts, and soy foods are good sources of plant proteins.
4. Eat more whole-grain breads and cereals
 - Aim for at least 3 servings of whole-grains daily (including brown rice and oatmeal).
 - Limit highly refined cereals such as white bread, pastry, white rice, and sugary cereals.
5. Choose healthy fats
 - Choose unhydrogenated vegetable oils and trans fat free margarine in place of animal and solid fats such as butter, hard stick margarine, and shortening.
 - Eat at least 1 serving of nuts daily (1 oz of nuts or 2 tablespoons of peanut or almond butter).
 - Eat foods high in n-3 fatty acids daily such as flax meal, walnuts, soy, or canola and soy oils.
6. Achieve/Maintain a healthy weight
 - A BMI less than 25 is ideal. A BMI of 30 or above indicates obesity and high risk.
 - A waist girth less than 37 inches for men and less than 32 inches for women is ideal.
 - A waist girth of 40+ inches indicates high risk for men and 35+ inches is high risk for women.
7. Be free of dependence on tobacco, illicit drugs, or alcohol
 - 85,000 people die prematurely every year due to alcohol
 - Over 400,000 people die prematurely every year from smoking
 - Drug use can lead to dependencies that can destroy physical, mental, and spiritual health
8. Maintain a cheerful, hopeful outlook on life
 - Choose to see the bright side of life. Be happy. Laugh a lot. Pass on joy and hope to those you work and live with daily. Get help if you feel sad and depressed for extended periods of time.
9. Spend quality time with family or friends daily
 - Supportive relationships build strong hearts and happy minds. Practice a spirit of friendship, love, and acceptance. Share a kindness with someone you live or work with daily.
10. Take time daily for spiritual renewal
 - Plan a quiet time each day to read, pray, meditate, and seek spiritual renewal. A heart primed with gratitude, forgiveness, and service helps you soar over life's difficulties and challenges.

Research summarily discredits the “21-day rule.” Phillippa Lally, PhD, a senior researcher at University College London, published a study that found it actually takes an average of 66 days — more than two months — to form a habit. Lally also reported that the amount of time before a new behavior feels automatic can range between 18 and 254 days.

“We don't really know what predicts the variation in times,” Lally says. But she does have a hunch: “It’s likely easier to consider that [a habit] feels automatic when it's a simpler behavior,” Lally says. Drinking a glass of water in the morning requires less work than starting to exercise regularly, for example; so you may feel as though you're able to incorporate the former into your routine more quickly than the latter.
